SUMMARY

Self-driven DevOps engineer with a 50-project production-grade portfolio spanning foundational infrastructure to principal-level platform engineering. Proficient in Kubernetes, CI/CD pipelines, Infrastructure as Code, cloud-native observability, and security. Brings proven operational and team leadership discipline from a high-volume restaurant environment, now applied to building reliable, scalable systems.

TECHNICAL SKILLS

Category	Technologies
Containers & Orchestration	Docker, Kubernetes, Helm, Karpenter, vCluster, KEDA
CI/CD & GitOps	GitHub Actions, ArgoCD, Flux v2, Tekton, Flagger, Argo Workflows
Infrastructure as Code	Terraform, Ansible, Crossplane, Cluster API (CAPI/CAPA)
Cloud (AWS)	VPC, EKS, Lambda, API Gateway, DynamoDB, Route53, S3, RDS, Spot, Savings Plans
Observability	Prometheus, Grafana, AlertManager, OpenTelemetry, ELK Stack, Fluent Bit, Loki
Security	HashiCorp Vault, OPA/Gatekeeper, Falco, Istio mTLS, SPIFFE/SPIRE, Cert-Manager
Networking	Nginx, Istio Service Mesh, Cilium/eBPF, Hubble
Languages	Python, Bash, Go
Platform Engineering	Backstage IDP, DORA Metrics, SLO/Error Budget (Sloth), RBAC Audit
AI/ML Infra	Kubeflow, MLflow, Seldon, GPU NodePools

PORTFOLIO PROJECTS

DevOps Portfolio — 50 Production-Grade Projects

50 end-to-end infrastructure projects across five tiers (Foundational → Principal), each with architecture diagrams, problem statements, design trade-offs, and production considerations.

Selected Highlights:

Custom Kubernetes Operator (Go) — Built a CRD-based operator using controller-runtime with finalizers and reconciliation loops; demonstrates deep Kubernetes internals and API machinery knowledge.

AI/ML Platform on Kubernetes — Deployed Kubeflow, MLflow, and Seldon on EKS with GPU NodePools and Karpenter for cost-optimized model training and serving.

Zero-Trust Architecture (SPIFFE/SPIRE) — Implemented workload identity with mTLS across all services, eliminating static credentials from the data plane.

GitOps Fleet Management — Multi-cluster ArgoCD with ApplicationSets and fleet-wide progressive delivery policies across environments.

Security Compliance as Code — Automated SOC2/CIS controls via OPA Gatekeeper with continuous evidence collection pipelines.

Chaos Engineering with LitmusChaos — Designed steady-state hypotheses, ran fault injection, and validated recovery SLOs via Argo Workflows.

eBPF Observability with Cilium — L7 network policy, WireGuard encryption, and deep packet inspection via Hubble — no sidecar overhead.

OpenTelemetry Observability Platform — Wired distributed traces, metrics, and logs through OTel Collector with auto-instrumentation and multi-backend integration.

Incident Response Automation — Python-based runbook executor integrating PagerDuty and Slack with automated MTTR tracking.

DORA Metrics Platform — Prometheus + GitHub API + PagerDuty pipeline surfacing deployment frequency, lead time, MTTR, and change failure rate in Grafana.

Personal Projects

Quant Trading Portfolio — 50-Project Roadmap, 2 Live

A live automated options/equities trading system on AWS EC2, plus a tracked roadmap of 50 supporting infrastructure projects across 5 tiers. Two are built and running against a real (paper) Alpaca account today:

Risk Pre-Trade Checker (github.com/Joevue123/risk-pre-trade-checker) — Middleware gate running before every live order submission: hard limits on position size (\$5,000), daily realized loss (\$500, read from the trade journal), and combined correlated exposure across SPY/QQQ/IWM (\$10,000). Breaches block the order and fire a Telegram alert; fails closed on an internal error without ever blocking the scanning loop.

Trade Journal Database (github.com/Joevue123/spx-scanner) — Postgres-backed journal logging every trade the live scanner triggers: real Alpaca fills, entry/exit price, P&L, and slippage, reconciled by a standalone service polling Alpaca's order API — replacing a prior JSON-file simulation capped at 500 entries.

Zoom Trading Transcription Bot (Python) Real-time audio capture from system output using pyaudiowatch, transcribed locally with faster-whisper (Tiny model — no API cost), analyzed by a local LLM (Llama 3.2 via Ollama). Keyword signal engine classifies BUY/SELL/ALERT events and writes to a live JSON bridge for a real-time dashboard. Multi-threaded with thread-safe signal state management.

Algorithmic Trading Signal System (Python) SMA crossover strategy backtested on SPY and BTC-USD using yfinance and pandas_ta. Generates long/short signals, plots entries against price history, and logs all trades with timestamps for performance review.

WORK EXPERIENCE

Kitchen Manager Full-Service Restaurant — Manhattan, NY

- Directed daily kitchen operations for a high-volume, full-service restaurant, coordinating a team of cooks and prep staff across peak service hours
 - Managed inventory, vendor ordering, and cost controls to meet food cost and labor budget targets
 - Enforced NYC health code and food safety compliance; maintained consistent passing inspection scores
 - Trained and onboarded new kitchen staff, building standard operating procedures to reduce errors during rushes
-

EDUCATION

Bachelor of Science — Microbiology University of Benin | Benin City, Nigeria
